Subject: 10 Lancer 850 - Wing Leading Edges

*New Cyclone Lancer 850*

*December 4, 2017*

Today I got a cabinet maker to saw two 3/8" X 1" leading edge strips out of the 3/8" X 3" X 48" balsa plank I had as shown below. The third strip was less than 1" wide of course.

As always, the internal stresses in the plank cause some "bowing" in the two 1" leading edge pieces. So I jugged them together on the work table with a counter bow as shown below. I will check the bow in them in the morning. If they are still bowed, which they probably will be, I guess I will try wetting them with water and rejigging them. Do you have a better way to take the bow out?.....Tandy
