Subject: 29 Lancer 850 - Installation of Bottom Rear Spar

New Cyclone Lancer 850

January 5, 2018

Yesterday considerable thought was given about what the next step should be. I decided to unpin the right wing panel and take it up off the work table this afternoon. The structure was placed inverted on the work table and the top rear spar was bridge clamped to the work table as you can see below to keep the rear portion of the wing straight. The leading edge was shimmed up with balsa to support the forward portion of the wing structure. The end of the bottom rear spar was trimmed to fit the inside of the curved wing tip and then carefully pushed into the notches on each rib. The rear spar was tacked to each rib with medium CA. This view shows the bottom rear spar installed on the right wing panel.....Tandy
