Subject: 41 Lancer 850 - Left Wing Panel (Brief Status-4)

New Cyclone Lancer 850

January 22, 2018

This evening I finally finished planking the top and bottom of the left wing tip including carving the tip to shape and most of the final sanding. The right and left wing panels were placed on the work table and this picture was taken for you to see. The right wing panel weighs 121 grams (4.27 oz) and the left wing panel weighs 125 grams (4.42 oz). The two wing panels differ in weight by only 4 grams or (0.14 oz).

The 4 sheets of 1/16" X 4" X 42" for the leading edge planking will be cut to fit, but not glue on at this time. First the panels will be jiggged up and the wing's center section LE, TE, and 4 spars will be cut to fit and glued in place. Then the 1/16" dihedral bracing for the main spar and leading edge will be clamped and glued in place before the leading edge planking is glued on.....Tandy
